Lista de exercícios hash em senhas

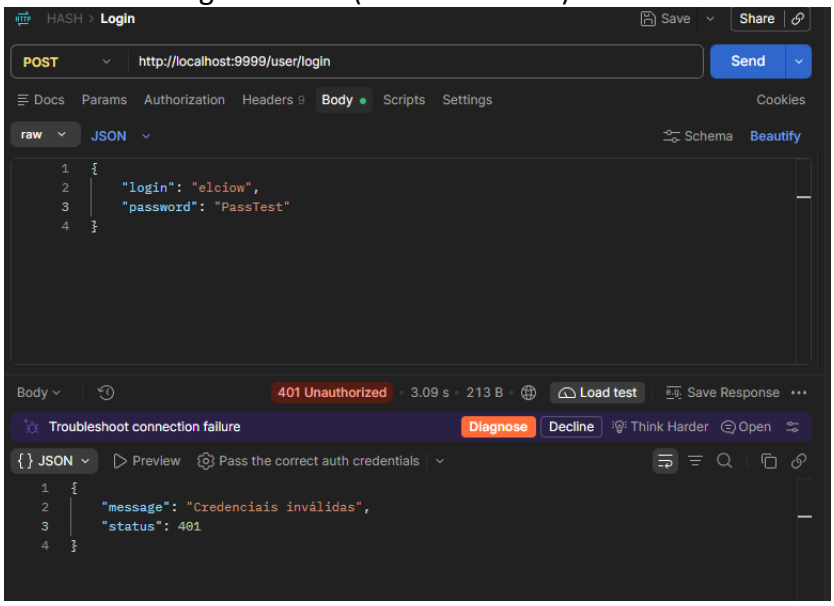

Registro ocorre normalmente:

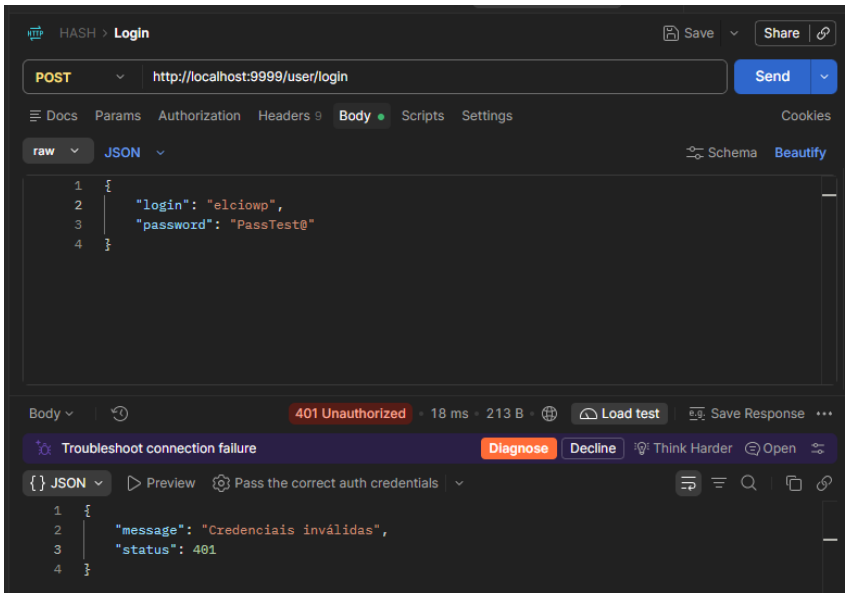

Salva o hash da senha no banco:

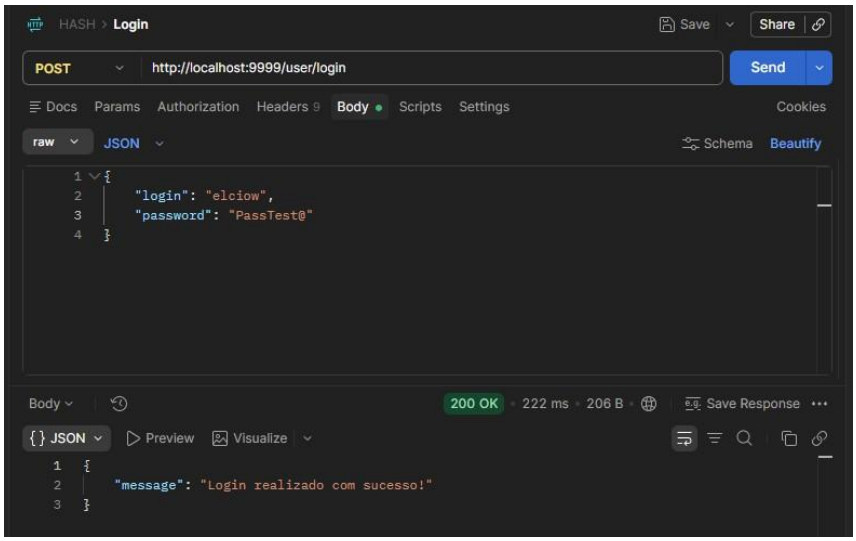

Tentativa de login inválida (senha incorreta):

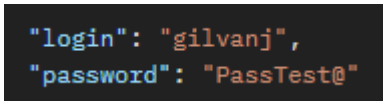

Tentativa de login inválida (usuário inexistente):

Tentativa de login válida:

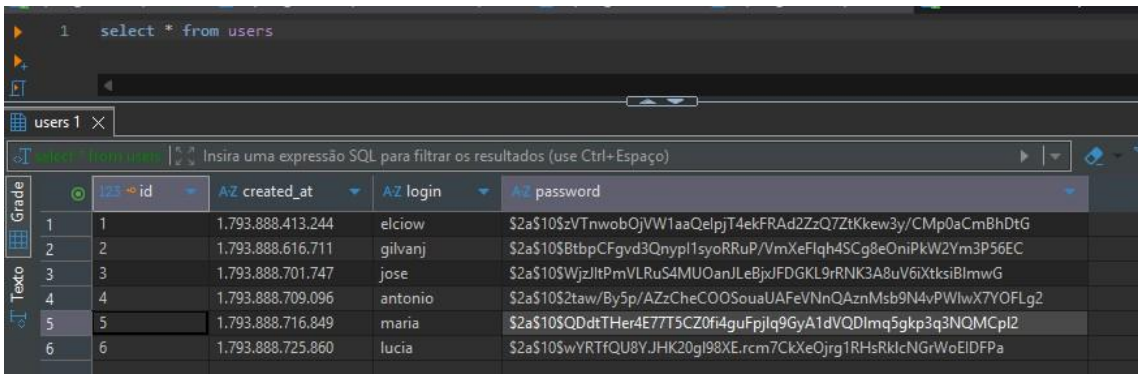

Observação, senhas iguais produzem hashs diferentes:

	id	created_at	login	password

Obs: Optei por apenas usar uma exceção de erro (“credenciais inválidas”) e uma exceção com pouco conteúdo para dificultar descobrir algo sobre o sistema apenas pela mensagem de erro do mesmo (tentar descobrir alguma parte do código, descobrir se uma conta já existe mas apenas a senha está incorreta, dentre outras fragilidades).
